The Dark Underbelly of Our Shiny, Clean Technology ***Green IT's increasing importance to business leadership***

By Rob Farris

The computer technology we all use every day, from our desktop and laptop machines to the servers and storage that keep our businesses and online destinations running, can have a significant environmental impact. On the surface, it doesn't seem so bad – they aren't belching pollution while we use them and they don't seem to be creating medical problems for their users (except for strained eyes and hands and perhaps for some the obsessive need to always be connected).

There are some serious considerations for companies to make related to the environmental and associated financial impact of using information and communications technology.
